**FOR IMMEDIATE RELEASE**

## **New *iGR* study forecasts wired backhaul for North American LTE metrocell deployments**

***Wired backhaul deployments will vary significantly due to the diversity of small cell locations***

**AUSTIN, Texas, May 30<sup>th</sup>, 2014** – Because the locations of small cell deployments vary so greatly, there is no single solution for how they will be backhauled. When operators choose backhaul methods for small cells, they go through a decision chain that balances current need (coverage versus capacity and the bandwidth requirements) against cost (and total cost of ownership), payback period and future scalability. Fiber is preferred over other backhaul options – other wired options (e.g., VDSL2, HFC) and wireless.

The main advantages for wired backhaul, fiber in particular, include high throughput, low latency and substantial throughput scaling over time. But there are two significant challenges with fiber: it is not always where it is needed and it is relatively expensive to deploy. However, once fiber is in place, the incremental cost of adding new capacity is low.

“Mobile operators’ choice in backhaul comes down to the specific challenge they are trying to overcome,” said Iain Gillott, president and founder of *iGR*, a market research consultancy focused on the wireless and mobile industry. “Although there are similarities and best practices across deployments, the actual technology choice comes down to the specific situation.”

*iGR*’s new market study *Wired Backhaul Opportunities and Issues for Small Cell Architectures* discusses the wired backhaul technologies available for small cells and the main market drivers for wired backhaul to support small cells. It also presents *iGR*’s North American forecast for wired backhaul to support LTE small cell deployments over the next five years.

The following key questions are addressed in the new market study:

- What is the anticipated growth of wired backhaul in North America through 2018?
- How do the major mobile operators view wired backhaul?

- What are the major concerns of the mobile operators with regard to wired backhaul?
- How can these concerns be addressed?
- What is the role for wired backhaul in small cell architectures?
- How is wired backhaul deployed?
- What are the attractions and drawbacks of wired backhaul for the mobile operators?

The information in this report will be valuable for:

- Cellular carriers, particularly those servicing the U.S. market
- Mobile backhaul providers, including telcos and cable MSOs
- Wired and wireless backhaul vendors and solution providers
- Mobile OEMs, particularly those servicing the U.S. market
- Wired and wireless infrastructure vendors, particularly those servicing the U.S. market
- Financial and investment analysts.

The new report can be purchased and downloaded directly from *iGR's* website at [www.iGR-inc.com](http://www.iGR-inc.com). Alternatively, contact Iain Gillott at (512) 263-5682 or at [iain@iGR-inc.com](mailto:iain@iGR-inc.com) for additional details.

## **About iGR**

*iGR* is a market strategy consultancy focused on the wireless and mobile communications industry. Founded by Iain Gillott, one of the wireless industry's leading analysts, in late 2000 as iGillottResearch, *iGR* is now entering its fourteenth year of operation. *iGR* continuously researches emerging and existent technologies, technology industries, and consumer markets. We use our detailed research to offer a range of services to help companies improve their position in the marketplace, clearly define their future direction, and ultimately improve their bottom line.

*iGR* researches a range of wireless and mobile products and technologies, including: smartphones; tablets; mobile wearable devices; connected cars; mobile applications; bandwidth demand and use; small cell and het-net architectures; mobile EPC and RAN virtualization; DAS; LTE; VoLTE; IMS; NFC; GSM/GPRS/UMTS/HSPA; CDMA 1x/EV-DO; iDEN; SIP; macro-, pico- and femtocells; mobile backhaul; WiFi and WiFi offload; and SIM and UICC.

A more complete profile of the company can be found at [www.igr-inc.com](http://www.igr-inc.com).
