New iGR study forecasts increasing number of global mobile connections through 2022

Some regions' connections will include 5G starting in 2018

AUSTIN, Texas, January 8th, 2018 – Mobile subscribers worldwide increasingly depend on a variety of mobile devices to stay connected. One mobile subscriber can use many mobile connections, as is evidenced by many countries' current mobile penetration rates of more than 100 per cent. In addition to a mobile phone or smartphone, a subscriber can connect through a tablet, or, increasingly, an embedded modem in a connected car or through a connected device in the Internet of Things (IoT).

iGR, a market research consultancy focused on the wireless and mobile industry, has recently released its forecast for the number of mobile connections in the world over the next five years. The overall global mobile connections penetration rate is expected to rise from 108 percent in 2017 to 130 percent in 2022. However, the number of mobile connections in each region of the world is expected to grow at different rates, due to each region's economic environment, its adoption rate of new technologies such as IoT, and its current mobile penetration.

"Aside from the increase in the number of connections, the other major change over the forecast period is the shift from 2G to 3G and 4G and then to 5G," said Iain Gillott, president and founder of iGR. "5G connections are integral to iGR's Mobile Connections forecast, as Non-Standalone 5G New Radio networks are expected to be commercially launched in select regions in 2018."

iGR's new market study, [**Global Mobile Connections Forecast, 2017-2022: Increasing 4G and 5G**](#), forecasts the number of mobile connections for the next five years at both the global level and for each of the following regions: North America, Latin America, Europe, Middle East and Africa, and Asia-Pacific. The study also forecasts the number of connections according to their generation (2G, 3G, 4G, or 5G) and their technology, such as GSM, UMTS/HSPA, LTE and 5G NR.

The following key questions are addressed in the new research study:

- How many wireless connections are there globally and in each major geographic region?
- What is the split of those connections by technology type – both air interface (GSM, CDMA, UMTS/HSPA, LTE, 5G NR) and generation (2G 3G, 4G, 5G)?
- What are the major markets for LTE and 5G throughout the forecast period?

- How many 5G connections does *iGR* forecast for 2018, the expected first year of launches of the 5G NR standard? How quickly will the number of 5G connections grow?

The information in this report will be valuable for:

- Mobile operators
- Device OEMs
- Mobile infrastructure and equipment OEMs
- Content providers and distributors
- Financial analysts and investors

About *iGR*

iGR is a market strategy consultancy focused on the wireless and mobile communications industry. Founded by Iain Gillott, one of the wireless industry's leading analysts, in late 2000 as *iGillottResearch*, *iGR* is now in its eighteenth year of operation. *iGR* continuously researches emerging and existent technologies, technology industries, and consumer markets. We use our detailed research to offer a range of services to help companies improve their position in the marketplace, clearly define their future direction, and ultimately improve their bottom line.

iGR researches a range of wireless and mobile products and technologies, including: smartphones; tablets; mobile wearable devices; connected cars; mobile applications; bandwidth demand and use; small cell and het-net architectures; mobile EPC and RAN virtualization; DAS; 5G NR; LTE; VoLTE; IMS; NFC; GSM/GPRS/UMTS/HSPA; CDMA 1x/EV-DO; iDEN; SIP; macro-, pico- and femtocells; mobile backhaul; WiFi and WiFi offload; and SIM and UICC.
